# Package 'kimma'

July 29, 2021

Type Package
Title Kinship In Mixed Model Analysis of RNA-seq
Version 0.1.0
Author Kim Dill-McFarland
Maintainer Kim Dill-McFarland <kadm@uw.edu></kadm@uw.edu>
<b>Description</b> Data analysis and linear mixed effects models with pairwise kinship for RNA-seq data.
License MIT + file LICENSE
Encoding UTF-8
LazyData true

align_metrics	Extract and format cleaning and alignment metrics	
align_metrics	Extract and format cleaning and alignment metrics	

## **Description**

Extract data from FastQC trim settings, Picard, samtools flagstat, and featureCounts output by the RNA-seq fastq pipeline

#### Usage

```
align_metrics(
  data.dir = NULL,
  trim = TRUE,
  bam = TRUE,
  picard = TRUE,
  bam.filter = TRUE,
  count = TRUE
```

## **Arguments**

data.dir Character string of directory containing all associated files
trim Logical if should include FastQC trim settings
bam Logical if should include samtools flagstat for raw alignments
picard Logical if should include Picard for raw alignments

bam.filter Logical if should include samtools flagstat for filtered alignments count Logical if should include featureCounts total reads in genes

# Value

Data frame cleaning and alignment metrics for all libraries

dat.example kimma example DGEList.			
	dat.example	kimma example DGEList.	

# Description

An edgeR DGEList data set containing unnormalized RNA-seq counts. RNA-seq of human dendritic cells cultured with and without virus. Samples from 3 donors and a random subset of 1000 genes were selected. Counts are unnormalized.

## Usage

```
dat.example
```

dat.voom.example 3

#### **Format**

Formal class 'DGEList' [package "edgeR"] with 1 slot:

1. **counts** A matrix with 1000 rows and 6 columns

rownames character. ENSEMBL gene ID.

lib1 integer. Counts in library 1.

lib2 integer. Counts in library 2.

**lib3** integer. Counts in library 3.

lib4 integer. Counts in library 4.

lib5 integer. Counts in library 5.

lib6 integer. Counts in library 6.

2. samples A data frame with 6 rows and 7 columns

**group** factor. No grouping was provided. All = 1.

lib.size numeric. Total library size for this 1000 gene subset.

**norm.factors** numeric. Normalizatin factors. No normalization was completed. All = 1.

libID character. Unique library ID. Matches column names in counts.

donorID character. Donor ID.

**median\_cv\_coverage** numeric. Median coefficient of variation of coverage. Quality metric for sequencing libraries calculated from original full data set.

virus character. A for media samples with no virus. B for virus-infected samples.

3. genes A data frame with 1000 rows and 5 columns

hgnc\_symbol character. Current approved HGNC symbol.

Previous symbols character. Previous HGNC symbols.

Alias symbols character. Alias HGNC symbols.

**gene\_biotype** character. Gene product type. All = protein-coding.

geneName character. ENSEMBL gene ID. Matches row names in counts.

dat.voom.example

kimma example EList.

## **Description**

A limma EList data set containing normalized log2 RNA-seq counts. RNA-seq of human dendritic cells cultured with and without virus. Samples from 3 donors and a random subset of 1000 genes were selected. Counts are TMM normalized log2 counts per million (CPM).

#### Usage

dat.voom.example

4 dat.voom.example

#### **Format**

Formal class 'EList' [package "limma"] with 1 slot:

1. **genes** A data frame with 1000 rows and 5 columns

hgnc\_symbol character. Current approved HGNC symbol.

Previous symbols character. Previous HGNC symbols.

Alias symbols character. Alias HGNC symbols.

**gene\_biotype** character. Gene product type. All = protein-coding.

geneName character. ENSEMBL gene ID. Matches row names in E.

2. **targets** A data frame with 6 rows and 7 columns

**group** factor. No grouping was provided. All = 1.

lib.size numeric. Total library size for this 1000 gene subset.

norm.factors numeric. TMM normalizatin factors.

libID character. Unique library ID. Matches column names in E.

donorID character. Donor ID.

**median\_cv\_coverage** numeric. Median coefficient of variation of coverage. Quality metric for sequencing libraries calculated from original full data set.

virus character. A for media samples with no virus. B for virus-infected samples.

3. E A matrix with 1000 rows and 6 columns

rownames character. ENSEMBL gene ID.

- **lib1** integer. log2 CPM in library 1.
- lib2 integer. log2 CPM in library 2.
- lib3 integer. log2 CPM in library 3.
- lib4 integer. log2 CPM in library 4.
- lib5 integer. log2 CPM in library 5.
- lib6 integer. log2 CPM in library 6.
- 4. weights A matrix with 1000 rows and 6 columns
  - 1 numeric. limma gene weights for library 1.
  - 2 numeric. limma gene weights for library 2.
  - 3 numeric. limma gene weights for library 3.
  - **4** numeric. limma gene weights for library 4.
  - 5 numeric. limma gene weights for library 5.6 numeric. limma gene weights for library 6.
- 5. **design** A matrix with 6 rows and 1 column
  - C 1M ' 1' 1 C 1 1 '

**GrandMean** numeric. limma default design matrix.

extract\_lmFit 5

extract\_lmFit

Extract lmFit model results

#### **Description**

Extract model fit and significance for all individual variables and/or contrasts in a limma model

#### Usage

```
extract_lmFit(
  design,
  fit,
  contrast.mat = NULL,
  dat.genes = NULL,
  name.genes = "geneName"
)
```

#### **Arguments**

```
design model matrix output by model.matrix()

fit MArrayLM model fit output by limma::eBayes()

contrast.mat contrast matrix output by limma::makeContrasts()

dat.genes data frame with additional gene annotations. Optional.

name.genes character for variable name in dat.genes that matches gene names in fit
```

#### Value

Data frame with model fit and significance for all variable and genes. Format as in limma::topTable()

## **Examples**

gene\_plots

filter\_rare

Filter rare and low abundance genes

# Description

Filter genes at a minimum counts per million (CPM) in a minmum number or percent of total samples.

# Usage

```
filter_rare(
  dat,
  min.CPM,
  gene.var = "geneName",
  min.sample = NULL,
  min.pct = NULL,
  plot = FALSE
)
```

## **Arguments**

dat	DGEList output by edgeR::DEGList()
min.CPM	numeric minimum counts per million (CPM)
gene.var	character name for column with gene names in dat\$genes that matches names in expression data dat\$E. Default "geneName"
min.sample	numeric minimum number of samples
min.pct	numeric minimum percent of samples (0-100)
plot	logical if should plot mean variance trends

# Value

DGEList object filtered to not rare genes

# **Examples**

```
dat.filter <- filter_rare(dat = dat.example, min.CPM = 0.1, min.sample = 3)
dat.filter <- filter_rare(dat = dat.example, min.CPM = 0.1, min.pct = 10, plot = TRUE)</pre>
```

gene\_plots

Title

# Description

Title

gene\_plots 7

## Usage

```
gene_plots(
  dat = NULL,
  counts = NULL,
  meta = NULL,
  genes = NULL,
  fdr,
  model.name = NULL,
  libraryID = "libID",
  geneID = "geneName",
  subset.genes = NULL,
  variables,
  interaction = NULL,
  colorID = NULL,
  colors = NULL,
  ylab = "Normalized log2 expression",
  width = 5,
  height = 5,
  outdir = "figs/",
  cores = 2
)
```

# **Arguments**

cores

dat	DGEList or EList object with expression data (counts, E), sample metadata (samples, targets), and gene annotation (genes)
counts	If dat not provided. Data frame of gene expression. Genes are rows, samples are columns. geneID must be rownames or first column
meta	If dat not provided. Data frame of sample meta data with samples as rows.
genes	Optional if dat not provided. Data frame of gene annotation with genes as rows.
fdr	Optional. Model results output by kmFit()
model.name	Optional. Character string of model name to include in fdr results
libraryID	Character string of variable name to use when combining expression and sample data
geneID	Character string of variable name to use when combining expression and gene data
subset.genes	Optional. Character vector of genes to plot. Must match names in geneID column. If not provided, all genes are plotted.
variables	Character vector of variable names to include in plot. Variables can be character, factor, or numeric
interaction	Logical if plot interaction effect of first two variables
colorID	Character string of variable to color data points
colors	Optional character vector of colors for colorID. If not provided, default ggplot is used
ylab	Character string of y-axis lab
width	Numeric figure width in inches
height	Numeric figure height in inches
outdir	Character string of output directory

Numeric cores to run in parallel

8 kmFit

#### Value

Save individual pdf plots for each gene to outdir

## **Examples**

```
subset.genes <- c("ENSG00000250479","ENSG00000250510","ENSG00000255823")
fdr <- kmFit(dat = dat.voom.example,
    patientID = "donorID",
    kin = kin.example, run.lmekin=TRUE,
    subset.genes = subset.genes,
    model = "~ virus + (1|donorID)")#'
gene_plots(dat = dat.voom.example, fdr = fdr, subset.genes = subset.genes,
    variables = "virus", colorID = "virus")</pre>
```

kin.example

kimma example kinship.

## **Description**

Matrix of pairwise kinship values between donor 1,2,3. Values are dummy data with 1 for self comparison, 0.5 for siblings, and 0.1 for unrelated.

## Usage

```
kin.example
```

#### **Format**

A matrix with 3 rows and 3 variables:

```
rowname Donor ID. Same as column names donor1 numeric kinship (0-1) with donor 1 donor2 numeric kinship (0-1) with donor 2 donor3 numeric kinship (0-1) with donor 3
```

kmFit

Linear mixed effects models with kinship for RNA-seq

# **Description**

Run lmekin and corresponding lm or lme without kinship of gene expression in RNA-seq data

kmFit 9

#### Usage

```
kmFit(
  dat = NULL,
  kin = NULL,
  patientID = "ptID",
  libraryID = "libID",
  counts = NULL,
  meta = NULL,
  genes = NULL,
  subset.var = NULL,
  subset.lvl = NULL,
  subset.genes = NULL,
  model,
  run.lm = FALSE,
  run.lme = FALSE,
  run.lmekin = FALSE.
  run.contrast = FALSE,
  contrast.mat = NULL,
  processors = 1,
  p.method = "BH"
)
```

#### Arguments

dat	EList object output by voom(). Contains counts (dat\$E), meta (dat\$targets),
	and genes (dat\$genes).

kin Matrix with pairwise kinship values between individuals. Must be numeric with

rownames.

patientID Character of variable name to match dat\$targets to kinship row and column

names.

libraryID Character of variable name to match dat\$targets to dat\$E colnames

counts Matrix of normalized expression. Rows are genes, columns are libraries.

meta Matrix or data frame of sample and individual metadata.

genes Matrix or data frame of gene metadata.

subset.var Character list of variable name(s) to filter data by.

subset.lvl Character list of variable value(s) or level(s) to filter data to. Must match order

of subset.var

subset.genes Character vector of genes to include in models.

model Character vector of model starting with ~ Should include (1|patientID) if mixed

effects will be run

run.lm Logical if should run lm model without kinship
run.lme Logical if should run lme model without kinship
run.lmekin Logical if should run lmekin model with kinship

run.contrast Logical if should run pairwise contrasts. If no matrix provided, all possible

pairwise comparisons are completed.

contrast.mat Numeric contrast matrix created limma::makeContrasts()

processors Numeric processor to run in parallel

p.method Character of FDR adjustment method. Values as in p.adjust()

10 make\_modules

#### Value

Dataframe with model fit and significance for each gene

## **Examples**

```
# All samples and all genes
# Not run
# kmFit(dat = dat.voom.example,
       patientID = "donorID", libraryID = "libID",
#
#
        kin = kin.example, run.lmekin = TRUE,
        model = "~ virus + (1|donorID)")
# Subset samples and genes
kmFit(dat = dat.voom.example,
      patientID = "donorID", libraryID = "libID",
      kin = kin.example, run.lme = TRUE,
      subset.var = list("donorID"), subset.lvl = list(c("donor1", "donor2")),
      subset.genes = c("ENSG00000250479","ENSG00000250510","ENSG00000255823"),
      model = "~ virus + (1|donorID)")
# Pairwise contrasts
kmFit(dat = dat.voom.example,
      patientID = "donorID", libraryID = "libID",
      kin = kin.example,
      run.lme = TRUE, run.contrast = TRUE,
      subset.genes = c("ENSG00000250479","ENSG00000250510","ENSG00000255823"),
      model = "~ virus + (1|donorID)")
```

make\_modules

Construct WGCNA modules and associated data

## **Description**

Make WGCNA modules from gene expression data with dynamic soft threshold selection. Also outputs mean module expression and DAVID formatted gene lists

## Usage

```
make_modules(
  dat,
  genes = NULL,
  Rsq.min = NULL,
  sft.value = NULL,
  minModuleSize = 20,
  deepSplit = 3,
  nThread = 2
)
```

# Arguments

dat limma EList output by voom()

genes Character vector of genes to used in module building. Must match rownames in dat. If not set, all genes in dat are used

summarise\_kmFit 11

Rsq.min	Numeric minimum R-squared for soft threshold selection. If set, sft.value is not used
sft.value	Numeric soft threshold. Set when minimum R-squared is no used
${\tt minModuleSize}$	Numeric minimum module size
deepSplit	Integer value between 0 and 4. Provides a simplified control over how sensitive module detection should be to module splitting, with 0 least and 4 most sensitive
nThread	Integer for number of threads to use

#### Value

## List including:

- genes Character vector of genes used in module building
- sft Data frame with soft thresholding selected for module building. Includes power, minimum R-squared, and connectivity
- sft.plot ggplot object of soft thresholding topology and connectivity
- mods Data frame of genes in modules
- mods.voom Data frame of mean module expression in each library
- david DAVID formatted data frame of genes in modules

## **Examples**

```
dat.mods <- make_modules(dat = dat.voom.example, sft.value = 1)</pre>
```

 ${\tt summarise\_kmFit}$ 

Summarise kmFit FDR results

# **Description**

Summarise number of significant genes at various FDR cutoffs. Can split by up/down fold change as well.

## Usage

```
summarise_kmFit(
  fdr,
  fdr.cutoff = c(0.05, 0.1, 0.2, 0.3, 0.4, 0.5),
  contrast = FALSE,
  FCgroup = FALSE,
  intercept = FALSE
)
```

# **Arguments**

fdr data.frame output by kimma::kmFit()

fdr.cutoff numeric vector of FDR cutoffs to summarise at

contrast logical if should separate summary by pairwise contrasts within variables

FCgroup logical if should separate summary by up/down fold change groups

intercept logical if should include intercept variable in summary

12 summarise\_lmFit

#### Value

Data frame with total significant genes for each variable at various FDR cutoffs

## **Examples**

summarise\_lmFit

Summarise lmFit FDR results

## **Description**

Summarise number of significant genes at various FDR cutoffs. Can split by up/down fold change as well.

# Usage

```
summarise_lmFit(
  fdr,
  fdr.cutoff = c(0.05, 0.1, 0.2, 0.3, 0.4, 0.5),
  FCgroup = FALSE,
  intercept = FALSE
)
```

# Arguments

fdr data.frame output by kimma::extract\_lmFit()
fdr.cutoff numeric vector of FDR cutoffs to summarise at

FCgroup logical if should separate summary by up/down fold change groups

intercept logical if should include intercept variable in summary

#### Value

Data frame with total significant genes for each variable at various FDR cutoffs

summarise\_lmFit 13

# **Examples**

```
# Run limma model
design <- model.matrix(~ virus, data = dat.voom.example$targets)
fit <- limma::eBayes(limma::lmFit(dat.voom.example$E, design))

## Get results
fdr <- extract_lmFit(design = design, fit = fit)

# Summarise results
fdr.summary <- summarise_lmFit(fdr = fdr, fdr.cutoff = c(0.05, 0.5), FCgroup = TRUE)</pre>
```

# **Index**
